

# Our Electronic Labeling Plug-in is the UCC-128 Labeling solution you need!

You can auto-generate UCC-128 numbers within the ASN and print trading partner approved UCC-128 labels!

No more having to individually enter each UCC-128 number! Customizing each UCC-128 number by trading partner is as simple as entering basic data in just three fields... one time! The check digit is automatically calculated.

Ship to the distribution center or your customer's store. The ELP references the "ship to" code to automatically populate the label with the correct address.

UCC-128 number is automatically serialized. After the UCC-128 number has been set up in the EPP, it will automatically be entered into the ASN and serialized.

Labels, with one button click... After the ASN's have been created, select the ASN's that are shipping and click the Label Button.

TrueCommerce Transaction Manager™ automatically populates the various UCC-128 trading partner templates with the appropriate data from the ASN before sending the UCC-128 templates to the printer where they are automatically printed out.

The image displays three screenshots of the TrueCommerce Transaction Manager software interface. The top screenshot shows the 'Label Setup' window for UCC-128, where fields for 'Next UCC #', 'Extension', 'Company #', and 'Next Serial #' are visible. A note states: 'The combined entries for Company # and Next Serial # cannot exceed 16 characters.' The middle screenshot shows an 'Outbox - 9 - Ship Notice/Manifest - Standard' window with a table listing items for shipping, including UPC #, EAN #, Model #, Description, Quantity, and UOM. The bottom screenshot shows the 'Transactions' window with a list of trading partners and documents, and a large printed label for 'ACME, INC.' with PO Number ECWE12345678, SKU descriptions, quantities, and a barcode.
